

Ticket Raising Guide

1. When Should You Raise a Ticket?

Raise a ticket **only when troubleshooting steps do not resolve the issue** or when user intervention cannot fix it.

You should raise a ticket for the following:

1.1 Technical Issues

- Portal/application not loading
- 404 / 500 system errors
- Application crashes or hangs
- Document upload failures
- Slow performance or server unavailability

1.2 User Account & Authentication Issues

- Incorrect login/credential failures
- OTP/email not delivered after multiple retries
- Locked account
- MFA/authenticator issues

1.3 Documentation & Knowledge Base Issues

- Missing Confluence pages
- Broken URLs
- Outdated SOP/process content
- Incorrect document version

1.4 Application Processing / Workflow Issues

- Application status not updating
- Verification delays beyond SLA
- Incorrect details showing on application
- Wrong user mapping
- Duplicate application not resolved

1.5 Business Clarifications

If needed information is **not available** in existing knowledge base or documentation, raise a ticket for:

- Eligibility clarifications
- Workflow or process-related queries
- Policy/criteria mismatch

2. Ticket Categories

Tickets should be classified correctly to ensure faster routing and resolution.

2.1 Technical Issues

Examples:

- Application stuck at loading screen
- “Internal Server Error (500)”
- Page not rendering properly
- Attachment upload failures
- Forms not saving or freezing

Category to choose: *Technical / IT Application Support*

2.2 User Account Issues

Examples:

- Incorrect password
- Locked account
- OTP not received
- Wrong email/phone mapping
- Verification email not delivered

Category: *User Access / Authentication*

2.3 Documentation or Content Issues

Examples:

- Missing Confluence page
- Incorrect information in KB
- Broken hyperlink

- Outdated SOP or process flow

Category: *Documentation / Knowledge Base*

2.4 Application Processing Issues

Examples:

- Status stuck in “Pending Verification”
- Duplicate application not cleared
- Incorrect user/applicant details
- Workflow failure (e.g., approval not triggered)

Category: *Application Workflow / Processing*

3. Mandatory Fields Required for Ticket Creation

Each support ticket must include the following:

3.1 Summary (Title)

A clear, one-line description of the issue.

Examples:

- “Unable to upload KYC document for Individual Application”
- “OTP not received for login verification”
- “Confluence page for eligibility missing”

3.2 Description (Detailed Explanation)

Include the following:

1. **Issue Details**

What happened?

2. **Steps to Reproduce**

Example:

- Logged into portal
- Opened application form
- Clicked ‘Submit’
- Error appeared

3. **Expected Behavior**

What should have happened?

4. **Actual Behavior**

What occurred instead?

5. **Screenshots / Video (if applicable)**

Add evidence for better debugging.

3.3 Priority Level

Priority	Use When
P1 – Critical	Portal down, no users can access. Application completely blocked.
P2 – High	Key functionality broken for a user/team.
P3 – Medium	Non-blocking issues, intermittent problems.
P4 – Low	Cosmetic/UI issues, documentation suggestions.

3.4 User Information

Provide:

- Full Name
- Email ID
- Phone Number
- Department/Team (optional)
- **Application ID / Ticket Reference** (if relevant)
- Device/Browser used

3.5 Attachments

- Screenshots of error
- Logs (if requested)
- Document samples (if upload is failing)

4. Ticket Creation Flow (Inside Chatbot → Jira/SNOW Integration)

The process followed by your AI assistant or IT portal:

Step 1 — User clicks “Raise Ticket” button

Displayed after troubleshooting steps fail or user manually requests support.

Step 2 — AI Assistant gathers details

AI asks for:

- Category
- Issue description
- Priority
- Email/phone
- Application ID (if any)
- Screenshot upload

Step 3 — AI validates information

The assistant checks:

- Required fields filled
- Correct category match
- User contact is valid

Step 4 — AI creates ticket using Jira/SNOW API

- Automatically pushes data to Jira or ServiceNow
- Creates ticket in the appropriate queue
- Assigns default priority
- Routes to the correct support team

Step 5 — User receives confirmation

AI responds with:

- **Ticket ID**
- **Ticket link** (Jira/SNOW URL)
- Support team queue name
- A note if additional information is required

5. Track, Update, or Add Comments to Your Ticket

Users can track progress via:

5.1 Ticket Dashboard (Jira or SNOW)

You can view:

- Status: *Open* → *In Progress* → *Resolved* → *Closed*
- Assigned support agent
- SLA timer
- Resolution comments

5.2 Email Notifications

You will receive:

- Ticket creation confirmation
- Status updates
- Agent queries
- Ticket resolution details

5.3 Adding More Information

If support asks for additional details:

- Reply directly in the ticket comments section
- Upload requested screenshots/docs
- Provide clarification to avoid delays

6. Best Practices for Faster Resolution

- Always attach screenshots of the issue
- Provide timestamps and error codes
- Mention browser + device details
- Clearly describe steps performed before error
- Keep responses timely to avoid SLA breaches
- Choose the correct category to ensure faster routing

7. What Not To Do

Avoid:

- Raising duplicate tickets
- Using incorrect categories
- Leaving description fields blank
- Adding irrelevant/incorrect screenshots
- Marking everything as P1 without impact analysis

8. Ticket Closure

A ticket is closed when:

- Issue is resolved
- Required information is provided
- User confirms resolution
- No response from user after multiple reminders (auto-close)
